Motorola Professional Radio Series motorola professional series radio mcs2000 ii iii | 1979 1976 | modems Motorola 675 19.99 The Motorola 675 was used to connect wireless modems and radios to telephone switches at Motorola's. Modern electronic devices use a variety of disk drives for reading and writing data. Data is conventionally stored on rotating storage media and read by a moving read/write head. The data is organized into sectors which are the smallest individually addressable storage units. The size of a sector varies from device to device depending on the storage technology used. The current standard used for PC disk drives is the 512 byte sector size. However, the size of the sector may vary between manufacturers, the sector size depends on the storage technology used, and the sector size depends on the device's operating system. Data is stored on storage media by using the read/write head to write data to the media by magnetizing the storage media material in the presence of the read/write head. Data is read from the media by sensing the magnetic field of the storage media material as the read/write head passes over the storage media. As consumers have become more confident in the reliability of modern electronic devices, the importance of data protection has also increased. Many devices use some form of backup software or hardware that provides data protection. Data can be restored from a backup media using the same device, or another device, that stored the data originally. 3e33713323
